Efficient America: Greening the Industrial Workforce

Wednesday, June 2nd, 9:30-11am
Rayburn Gold Room (#2168), Rayburn House Office Building

Breakfast Will be Provided.

Volatile energy costs and an anticipated shift to low-carbon manufacturing have positioned energy management as top-of-mind for many U.S. manufacturers. Today, modern manufacturers require equipment operators, managers, engineers and consultants to have a firm foundational knowledge of energy and energy efficiency principles, and their impacts on top-line revenue growth, bottom-line capital costs and associated emissions. This emphasis on energy, efficiency and productivity requires a trained and experienced workforce.

The Alliance to Save Energy invites you to [Greening the Industrial Workforce](#), an educational briefing intended to explore the state of active training programs that are integrating energy efficiency into the preparation of next-generation manufacturing professionals. This program will also underscore the criticality of a qualified workforce in achieving mid- and long-term climate goals, while sustaining a robust domestic economy.

Panelists will represent a number of perspectives, each of which have accrued years of experience in industrial energy management and have first-hand knowledge of workforce training capabilities and deficiencies.

About the Series

This dialogue is the sixth in our series, [Efficient Enterprises: Powering American Industry](#). Over the next year, the Alliance to Save Energy will continue to offer briefings focused on topics most relevant to enhancing U.S. industrial energy efficiency. Programs will feature subject experts from industry, academia and government to share respective viewpoints on featured topics. Briefings will be scheduled and announced individually. These events are free and open to the public.
